M.R.I. BRAIN (P+C)

Axial – T1, T2, FLAIR DWI, Sagittal – T2 & Coronal – T2WI
AXIAL, SAGITAL, CORONAL-CONTRAST.

OBSERVATIONS

An extraaxial lobulated intense post contrast enhancing dural based mass lesion noted in middle & anterior cranial fossa showing FLAIR/T2 hyperintense & T1 hypo to isointense SOL along calvaria at right sphenoid ridge & infratentorial falx region with showing mass effect & abutting adjacent brain parenchyma causing compression of 3rd ventric associated mild dilatation of lateral ventricle with periventricular FLAIR hyperintensity. It is measuring 84x65x77mm (CCxAPxTR). Midline shift towards left side(15mm). Mass effect upon the right temporal lobe is noted with no perifocal edema. It is abutting the sphenoorbital fissure. Intralesional tiny blooming on SWAN-calcifications.

Rest Both cerebral parenchyma are normal in MR morphology & signal intensity.

Rest no focal restricted diffusion or blooming seen.

Brain stem & bilateral cerebellar hemispheres are normal.

No CP angle mass lesion.

Rest of the cerebral vasculature unremarkable.

Rest no abnormal post contrast enhancement seen.

Bilateral orbital globes & optic nerves unremarkable. No retrobulbar mass.

IMPRESSION:

- An extraaxial lobulated peripheral enhancing dural based right sphenoid meningioma showing mass effect associated midline shift towards left side(15mm), mass effect upon the right temporal lobe is noted with no perifocal edema. It is abutting the sphenoorbital fissure associated supratentorial hydrocephalus with periventricular FLAIR hyperintensity.
- Abnormal T2 hyperintensity noted in bilateral sphenoid & maxillary sinuses.

Suggested- Clinical & pathological correlation.
